Installing the *XML Tools* Plugin for *Notepad++*

1. Make sure that **Notepad++** is not currently running.
2. Download the **XML Tools** plugin from <https://tinyurl.com/y87czbul>

If the download does not start after a few seconds, click the “**Problems Downloading?**” button and then select the “**direct link**” from the pop-up window that is displayed.
3. Retrieve the Zip file from the **Downloads** folder and extract it.
4. Copy the extracted file **XMLTools.dll** (only) to the folder
C:\Program Files\Notepad++\Plugins
5. Copy the files found in the extracted **dependencies** folder to
C:\Program Files\Notepad++
6. Launch **Notepad++** and check that the **XML Tools** option now appears in the **Plugins** menu.

Note that, as the PC image is refreshed every time the machine is booted, you will need to repeat this operation each time you log in. However, we will only need the **XML Tools** plugin for the first couple of weeks, so it shouldn't be too much of a hassle.
